

INFLATING YOUR VECTRAN BOAT

Your Vectran boat comes with a small plastic inflation tube. This tube is to be used ONLY after you have inflated your boat with first, the inflation bag and then your lungs as tight as you can get it. Your lungs can put a lot more air into your boat quickly than the inflation pump can. Your lungs just can't put the pressure into the boat that you want with the Vectran.

Once your boat is as tight as you can get it using the inflation bag and your lungs, THEN top it off with the little air pump. Done this way, the air pump can tighten up the boat quite quickly. If you go straight from the inflation bag to the little plastic air pump, it will take you a long time to get the pressure you want in your boat.

Safe and Happy Boating!
